

ABSTRACT OF THE DISCLOSURE

A document image scanner capable of branding thermally printed tickets using a single feed roller. The contact image sensor and the thermal print head are both configured to apply pressure directly against the single feed roller. When not in use, the thermal print head may be retracted. The document scanner may include a print head that is wider than the document to be scanned, thereby enabling the scanner to be relatively insensitive to off centered and/or skewed documents inserted therein for scanning and/or branding.
